

Functional Convenience, Impressive Design

The Perfect Complement: Uniflex Shower Channels

Geberit International Sales AG, 07 April 2009

Floor-even showers at home are all the rage. And Uniflex shower channels are the perfect complement. The attractive and exclusive design lines of covers made from popular materials such as stainless steel (brushed, polished) and enamel or custom materials round out any sleek bathroom design.

The shower channel can be attached quickly and easily to concrete floors and helps ensure top layers are laid cleanly. The channel base has been patented by Geberit; its subsequent separation from the channel body and concrete floor ensure complete acoustic and electrical insulation. The height, inclination and offset of the frame can be adjusted to suit the thickness and size of tiles, the incline and the tile grid. Combined with the height-adjustable levelers, this affords maximum installation flexibility. The minimum installation height of the shower channel is 100 mm. The channel is available in countless attractive design lines in lengths of 700, 800, 900 and 1,000 mm.

At a glance:

- Full acoustic and electrical insulation
- Attractive design lines
- High level of flexibility and error tolerance
- High drainage capacity thanks to two outlets: 0.8 l/s at 15 mm damming height
- Minimum installation height 100 mm
- Available in lengths of 700, 800, 900 and 1,000 mm
- Custom materials available during design
